

1. The Problem

Training for Tough Conversations is Hard

Sales and support teams—especially small ones—face a difficult challenge:

- Role-playing with colleagues is awkward and doesn't scale.
- Learning on the job with real customers risks relationships and revenue.
- Generic scripts rarely reproduce the pressure and timing of a real voice call.

They need a lightweight, accessible way to **practice** difficult conversations before the real call.

2. The Product

Sparring: Practice by Voice

Sparring is designed to provide short, repeatable voice practice with a simulated customer.

- **Select:** Choose a difficult scenario (e.g., late delivery, price comparison, cancellation request).
- **Practice:** Talk to a simulated customer who challenges vague answers and raises realistic objections.
- **Review:** Understand the evidence behind your feedback.
- **Repeat:** Practice a better response to build confidence.

3. In Action

Demo Scenario: Late Delivery

Example scenario: a customer asks for a 30% discount after a delayed order. The trainee has limited authority and must offer a policy-safe next step.

During the call: a tool proposes an observation, names the rubric criterion, and supplies an exact trainee quote. The server checks that evidence before updating the score.

The session ends with targeted coaching: one strength, one area for improvement, and an alternative response that stays within company policy.

4. Technology

Built for Trust & Transparency

- **Voice interaction:** The browser connects to AssemblyAI's Voice Agent API using a short-lived server-issued token.
- **Real-time Hooks:** Function calls propose behavioral observations during the call.
- **Deterministic Validation:** Application logic strictly validates quoted evidence and calculates a transparent rubric.

Trust Boundaries: Scores are formative feedback, not professional certification. Our tool shows the exact coverage and limitations of every AI judgment.

5. Business Value

Practice Before the Real Call

- **Buyer hypothesis:** Small Spanish-speaking sales and support teams need repeatable practice without a complex rollout.
- **Distinctive loop:** Short voice role-play, evidence-backed feedback, and immediate retry.
- **Pilot measure:** Completion, perceived usefulness, and whether the next attempt improves one specific behavior.

Automated tests use a mock provider. Human voice testing and team pilot results will be reported separately.

6. Next Steps

Roadmap & Access

- **Immediate Next Step:** Human calibration testing and small-team pilots.
- **Future:** Team-specific scenarios, opt-in practice history, and measured coaching outcomes.
